

FILE:9051USF.RTF

WHAT IS CLAIMED IS:

1. A light source module, comprising:
a printed circuit board, on which a plurality of electrodes are formed;
a plurality of light-emitting diodes disposed on the printed circuit board and
5 electrically coupled together; and
at least one light-collecting column, disposed over the printed circuit board, and
covering the light-emitting diodes, wherein the a surface of the light-collecting column
has a plurality of first regions and a plurality of second regions, the first regions and the
second regions are arranged alternatively on the light-collecting column, wherein a
10 transmittance for the first regions is smaller than a transmittance for the second regions,
and the first regions are located above the light-emitting diodes.
2. The light source module according to claim 1, the first region is a forested
surface.
3. The light source module according to claim 1, the first region includes a first
15 ejected material and the second region includes a second ejected material.
4. A light source module, suitable for use in a scanner, comprising:
a printed circuit board, on which a plurality of electrodes are formed;
a plurality of light-emitting diodes disposed on the printed circuit board and
electrically coupled together;
20 at least one light-collecting column, disposed over the printed circuit board, and
covering the light-emitting diodes; and
a plurality of reflection boards, disposed between the light-emitting diodes and
the printed circuit board, so as to enhance a brightness at a region between the light
emitting diodes.

FILE:9051USF.RTF

5. The light source module according to claim 4, wherein each of the reflection boards comprises a plurality of reflection surfaces.

6. The light source module according to claim 4, wherein the reflection boards are used to reflect an incident light to a region between the the light-emitting diodes.
